### **LISTING OF CLAIMS**

Please consider the claims as follows:

1. (Currently Amended) A method for managing adjunct access for a circuit in a network management system, the method comprising the step steps of:  
identifying a non-managed portion of a circuit, wherein the non-managed portion of the circuit comprises a network portion including equipment and links unknown to the network management system;  
identifying a first managed portion of the circuit proximate the non-managed portion of the circuit;  
identifying a second managed portion of the circuit proximate the non-managed portion of the circuit; and  
providing a manageable link between the first managed portion of the circuit and the second managed portion of the circuit, the manageable link adapted for being characterized as a managed entity by a management system.
2. (Currently Amended) The method of claim 1, wherein the manageable link is coupled to at least one of a Digital Cross Connect (DCS), a Light wave Guided Cross Connects (LGX), and a Distribution Drop Point (DDP).
3. (Currently Amended) The method of claim 2, wherein the manageable link comprises at least one of a fiber optic cable, a twisted copper pair, and a coaxial cable.
4. (Currently Amended) The method of claim 2, wherein the manageable link comprises at least one of a digital carrier and an optical carrier.
5. (Currently Amended) A method for designing a continuous circuit, comprising the steps of:  
determining whether a non-managed portion of a circuit exists;

identifying the non-managed portion of the circuit, wherein the non-managed portion of the circuit comprises a network portion including equipment and links unknown to a network management system;

representing the non-managed portion of the circuit as a first network element, the first network element adapted for being characterized as a managed entity by the network management system;

identifying a second network element in a managed portion of the circuit proximate the non-managed portion of the circuit; and

providing a manageable link between the first network element and the second network element, the manageable link adapted for being characterized as a managed carrier link by the network management system.

6. (Currently Amended) The method of claim 5, wherein the manageable link is coupled to at least one of:

a Digital Cross Connect (DCS), a Light wave Guided Cross Connects (LGX), and a Distribution Drop Point (DDP).

7. (Currently Amended) The method of claim 6, wherein the manageable link comprises at least one of:

a fiber optic cable, a twisted copper pair, and a coaxial cable.

8. (Currently Amended) The method of claim 6, wherein the manageable link comprises at least one of:

a digital carrier and an optical carrier.

9. (Currently Amended) A method, comprising the steps of:

receiving a request to provision a circuit;

selecting a path for the circuit within a network comprising a plurality of network elements;

Serial No. 09/625,889

Page 4

assigning manageable links bridging non-managed portions of the circuit path by:

identifying, for each of the non-managed portions of the circuit path, a first managed portion of the circuit path and a second managed portion of the circuit path; and

providing, for each of the non-managed portions of the circuit path, a manageable link between the first managed portion of the circuit and the second managed portion of the circuit; and

characterizing the ~~assigned~~ manageable links as managed carrier links;

wherein the non-managed portions of the circuit path comprise network portions including equipment and links unknown to a network management system.

10. (Currently Amended) The method of claim 9, further comprising the step of:

determining if cross-connect network elements exist for bridging non-managed portions of said circuit path to managed portions of said circuit path; and

assigning available cross-connect network elements to ~~appropriate~~ the manageable links bridging the non-managed portions of said circuit.

11. (Original) The method of claim 9, wherein said non-managed portions of said network comprise at least one of adjunct access facilities or leased facilities.

12. (Currently Amended) An apparatus for designing a continuous circuit, comprising:

a processor and an associated storage device including instructions for controlling said processor, said instructions, when executed, causing said processor to perform the steps of:

Serial No. 09/625,889  
Page 5

determining whether a non-managed portion of a circuit exists;  
identifying the non-managed portion of the circuit, wherein the non-managed portion of the circuit comprises a network portion including equipment and links unknown to a network management system;  
representing the non-managed portion of the circuit as a first network element, the first network element adapted for being characterized as a managed entity by the network management system;  
identifying a second network element in a managed portion of the circuit proximate the non-managed portion of the circuit; and  
providing a manageable link between the first network element and the second network element in the managed portion of the circuit, the manageable link adapted for being characterized as a managed carrier link by the network management system.

13. (Currently Amended) The apparatus of claim 12, wherein the manageable link is coupled to at least one of:

a Digital Cross Connect (DCS), a Light wave Guided Cross Connects (LGX), and a Distribution Drop Point (DDP).

14. (Currently Amended) The apparatus of claim 13, wherein the manageable link comprises at least one of:

a fiber optic cable, a twisted copper pair, and a coaxial cable.

15. (Currently Amended) The apparatus of claim 13, wherein the manageable link comprises at least one of:

a digital carrier, and an optical carrier.
